Not illustrated. 1922 Excerpt: . . . pair of voltage leads which give about 86 per cent power-factor lead on the meter. The second method is to use a single-phase, indicating wattmeter, and with a lagging power factor on the line between 50 and 100 per cent select the pair of voltage leads which give the highest reading. Just after making the above test is the proper time to see that the contacts are held open. If they close, the voltage leads must be reversed. The above discussion is not based solely upon the mathematical study of the problem, but is the result of actual tests made on a number of transmission lines where the reverse energy relays connected according to the old method have not given satisfactory service. Experiments have shown that this method of connection should also be used on systems having a grounded neutral. This connection (with the current 30 deg....
