The consistent differences in textural characteristics between the Skin and Base regions for all three alloys can be attributed to the geometry-dependent variations in material flow during the extrusion process. Taylor-type models have been employed previously with some success to establish texture-processing relationships in rolled product 19, 20, 23, 26, 50, 51 . One such application of a relaxed constraint ( R ) model ( illustrated in Figure 1 ) predicts the formation of the Ex component by allowing 1 simultaneous shearing on the T plane in the L direction ( B-type shear ) and on the S plane in the L direction ( C-type shear ), i. e. the BC model 26 . In contrast, formation of the Brass component is predicted by allowing additional shear on the S plane in the...
